

Abstract

Presence dissertation: "Women's awareness of the risks associated with hormonal contraception" is a character a theoretical- empirical.

The theoretical part gives an overview of hormonal contraceptives, the dangers threatening the use of hormonal contraceptives and gynecological care.

Empirical basis of a questionnaire survey which was carried out in selected groups of women.

The aim of this dissertation: Investigate whether women have the sufficient knowledge of the risks associated with the hormonal contraceptive and determine whether gynecologists to ensure the essential prevention and whether women are satisfied with them. To find these objectives serve the questionnaire.

The work reveals the respondents' knowledge of risks associated with use of hormonal contraceptives, such knowledge is the basic level. Further reveals the difference between the groups, the level of knowledge and lack of care gynecologists. This work may contribute as educational material for health workers and women using or planning to use hormonal contraceptives.
